(a) Source: Australian Bureau of Statistics (ABS), customised report, 2016.

(b) Community population growth estimates are based on regional projections from the Department of Treasury and Finance published in *Northern Territory Population Projections Main Update (2014 Release)*. Projections are only available at the regional level and do not distinguish between the growth characteristics of individual communities.

(c) Population estimates for Acacia Larrakia and Kybrook Farm are not available from ABS and based solely on NTG estimates.

(d) ABS provides a single combined population estimate for Bulman and Weemol. This table uses an NTG estimate for the population of Weemol. The Bulman population estimate is then derived by subtracting the NTG

**Water resource and demand information**Community water resources have been assessed by PWC Remote Operations, please refer to IES reports on the PWC website: [www.powerwater.com.au/](http://www.powerwater.com.au/), Water resources are classed as either:

a) 'Limited' where a community water source 'Source Sustainability' risk score is minor or greater, AND the water source 'Alternative water source development potential' score is moderate or greater, or where an alternative water source has not been defined. Water resources where treatment is required have been classed as Limited because of high water production costs.

b) 'Adequate' where a community water source 'Source Sustainability' risk score is insignificant AND the water source 'Alternative water source development potential' score is insignificant or minor.

c) 'Undefined' where a community water source has no reliable estimate of sustainable yield. These communities require a hydrogeological resource assessment.

Water resource classifications only refer to the water resource and not to water production infrastructure, significant investment in infrastructure may be required to meet demand ie. equipping bores.

d) Actual average water demand is derived from the community water tank meter (not bores). ET figures only apply to lots shown on the SLAP map; consumers outside the SLAP map (if present) will need to be added for design.

For some communities, water production is much higher than the actual water demand due to the connection of other customers ie. outstations, pastoral properties.

**General information**Place names, Regional council, community maps, access information, refer to NT Government's BushTel website; [www.bushtel.nt.gov.au/](http://www.bushtel.nt.gov.au/)
