

Threatened Species of the Northern Territory

LESSER BILBY

Leporillus apicalis

Conservation status

Australia: Extinct

Northern Territory: Extinct

Description

The lesser bilby was a medium-sized marsupial (body mass of 300-435 g) that was both smaller and less colourful than the greater bilby. The lesser bilby was grey-brown above and paler below with a white tail that was about 70% of its head-body length.

Distribution

The species occupied spinifex and canegrass on dunes and sandy plains in two regions of arid Australia; the first in northeast South Australia and adjoining southeast Northern Territory, the other in the Gibson and Great Sandy Deserts of Western Australia and adjoining regions of the Northern Territory. The western distribution was discovered only after discussions with elderly Aboriginal people (Burbidge *et al.* 1988; Johnson and Southgate 1990).

Conservation reserves where reported:

None (although it may have formerly occurred in areas that are now included within Uluru Kata-Tjuta National Park and West MacDonnell National Park.)

Known locations of the lesser bilby.

o = pre 1970; • = post 1970

Ecology

The biology of the lesser bilby is poorly known. The species was nocturnal and sheltered during the day in a deep burrow dug amongst sand dunes. Its diet consisted of termites, ants and roots. It occurred in dunes and sandplains with spinifex, sometimes with mulga and/or tussock grass (Burbidge *et al.* 1988).

Conservation assessment

The lesser bilby is presumed to have become extinct in the NT in the 1960s, following a broad-scale decline extending over at least the previous 50 years (Burbidge *et al.* 1988). It was probably extinct in the southeast of the

NT by the first half of the twentieth century (Finlayson 1961).

Threatening processes

The decline and extinction of the lesser bilby is attributed to a range of factors including predation by cats and foxes, and habitat alteration due to the impacts of exotic herbivores and to changed fire regimes.

Conservation objectives and management

The species is presumed extinct. No conservation management plan can offer further help.
